Directions for Use

- Randomly select three 100-word passages from a book or an article.
- Plot the average number of syllables and the average number of sentences per 100 words on the graph to determine the grade level of the material.
- Choose more passages per book if great variability is observed and conclude that the book has uneven readability.
- Few books will fall into the solid black area, but when they do, grade level scores are invalid.

Additional Directions for Working Readability Graph

- Randomly select three sample passages and count exactly 100 words beginning with the beginning of a sentence. Don't count numbers. Do count proper nouns.
 - Count the number of sentences in the hundred words, estimating length of the fraction of the last sentence to the nearest 1/10th.
 - Count the total number of syllables in the 100-word passage. If you don't have a hand counter available, an easy way is to simply put a mark above every syllable over one in each word, then, when you get to the end of the passage, count the number of marks and add 100.
 - Enter graph with average sentence length and number of syllables; plot dot where the two lines intersect. Area where dot is plotted will give you the approximate grade level.
 - If a great deal of variability is found, putting more sample counts into the average is desirable.
